

## Watermark Removal and Customization

When you purchase a Doceri Desktop license, the watermark is automatically removed from the projected image that is output when connected through your computer. Customization and removal of the watermark from exported images, documents and screencasts is available through an in-app purchase.

First, select "Purchases" under the "Settings" menu to purchase Watermark Customization if you haven't already.

To remove the watermark, select "Drawings" under "Settings" and select "none". You will now be able to export your content without a watermark.

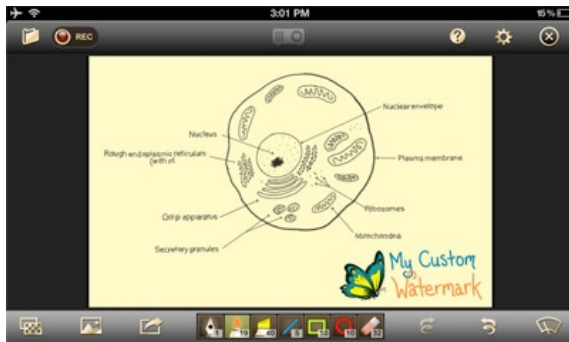

To use a custom watermark, first create the image in Doceri that you would like to use for a watermark. You may use inserted images, drawing strokes, or a combination of the two. Position the image exactly as you would like the watermark to appear. The saved watermark image will not include the background.

Select "Drawings" under "Settings" and select "Custom". Tap and hold in the image area to insert your custom watermark image.

Your exported content will now show your custom watermark.
